# Incident Handling Tabletop Workshop

How do you know if your incident response processes and plans really work?

Very few organisations detect cyber security incidents in a timely manner, and fewer still are able to handle and resolve them in an effective way to minimise impact. Why? Because when it comes to establishing an incident management and response capability, most organisations limit effort to developing a documented process sufficient to tick the “has an incident response process” box, with little or no focus on how effective the process is.

If this describes your situation then the **Incident Handling Tabletop Workshop** is for you!

In ***just one day*** the Tabletop Workshop provides an extremely effective way to safely evaluate and improve your incident response capabilities. The workshop ensures that participants go through all incident handling steps and do not get stuck in the incident detection phase. Featuring comprehensive paper-based exercises, the workshop provides hands-on experience in both detecting and responding to typical real-life incidents.

Participants will be provided with a brief introduction that sets the context for the incident including the technical environment, a generic incident handling process and an incident report template. For in-company presentations, this scenario is customised to your specific situation.

In addition, they will be provided with a set of artefacts that include real-world indicators of compromise that they must analyse to identify and respond to a set of incidents.

Participants then follow the process provided to analyse the information and filter the “noise” from what is meaningful and useful. They will be expected to perform incident handling activities including detection, triage, analysis, containment, eradication and recovery, while communicating and escalating issues to management and relevant stakeholders.
